

Spent (16 Sep–10 Oct)	Purchases	Cost per purchase	ROAS
₹38.4K	22	₹1,748	0.37
main ad set, 25 days	~6 a week	previous setup: ₹1,008	₹0.37 back per ₹1 spent

₹38.4K

22

₹1,748

0.37

1 purchase since reset 50 needed

It is **partly the budget and partly how the campaign is managed**. At ₹1,850 a day, no manager could get out of learning. But the ad set was also reset about **9 times in 25 days**, and the new setup is doing worse than the old one on every efficiency number. Learning alone will not fix ROAS. Five changes will.

8 cities, automatic audience off.
The old all-India setup got 2.4x
the clicks per view.

0.67 Previous setup

1.7-2.0 Break-even (est.)

QUESTION 1

Why is it still in the learning phase?

Two separate reasons. The first is maths, the second is management.

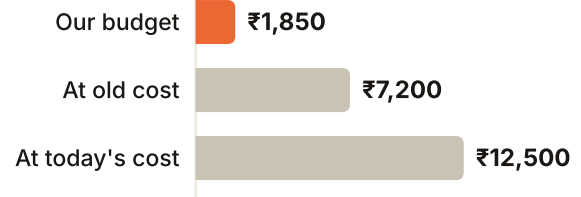

Reason A: not enough purchases

Purchases per week, new setup vs Meta's learning threshold

...and the budget cannot buy 50

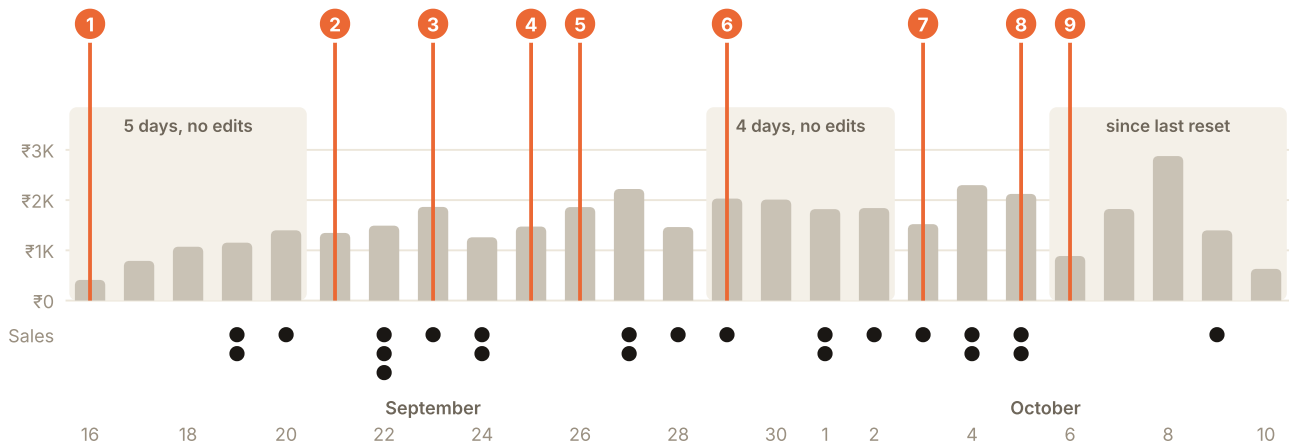

Daily budget to buy 50 purchases a week

What this means: at this budget a purchase campaign stays in "Learning" or "Learning limited" for good. That label alone is not the problem. Small brands run profitably while learning-limited. **The real problem is the cost per purchase.**

Reason B: the ad set keeps getting reset

Daily spend (grey bars), each restart of learning (numbered orange lines), and each day's sales (one dot per purchase)

- | | | |
|--------------------------------------|-------------------------------------|------------------------------------|
| 1. 16 Sep · Launched + creative swap | 2. 21 Sep · Targeting + budget +50% | 3. 23 Sep · New ad added |
| 4. 25 Sep · Targeting + budget | 5. 26 Sep · Main creative swapped | 6. 29 Sep · Diwali ad added |
| 7. 3 Oct · Influencer ad added | 8. 5 Oct · Targeting changed | 9. 6 Oct · Targeting + best ad off |

9 resets in 25 days

The longest stretch without a change was 5 days. Learning needs 7. It has never once had a full clean week.

The best ad was switched off

On 6 Oct the only ad that reliably converts ("Edamame") was turned off for two days. Sales dropped to zero on 6, 7 and 8 Oct.

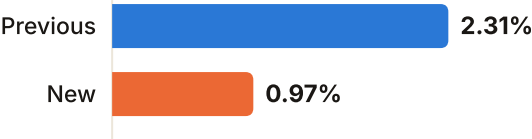

QUESTION 2

Is the new setup working properly?

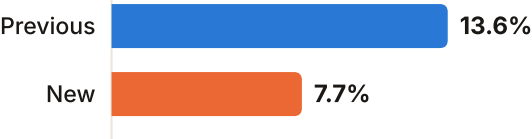

Not yet. Compared with the campaign it replaced, it is behind on every number, and it is not improving week to week.

Previous setup (Helium, 12 Aug–10 Sep) New manager's setup (Edamame TOF, 16 Sep–10 Oct)

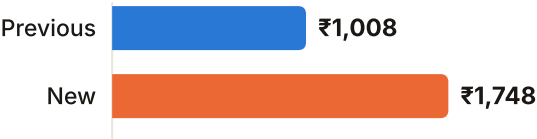

Click-through rate

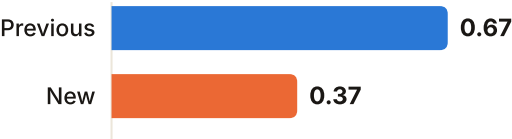

Visitors who add to cart

Cost per purchase (lower is better)

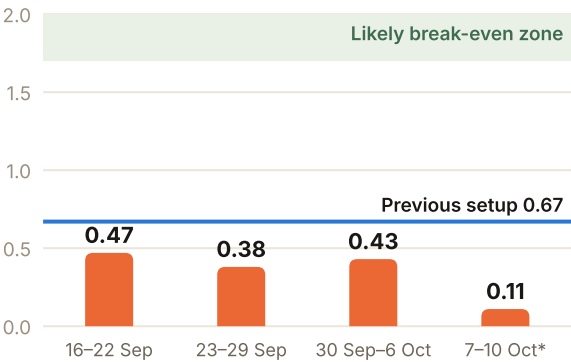

ROAS (higher is better)

Weekly ROAS of the new setup

Spend rose 60% after week 1. Sales did not follow. *4 days only

Targeting: then vs now

The campaign is named "Broad targeting"

	PREVIOUS	NEW
Area	All India	8 metro cities
Automatic audience	On	Off
Age	18–65	18–55
Excludes	None	IG engagers, 60 days

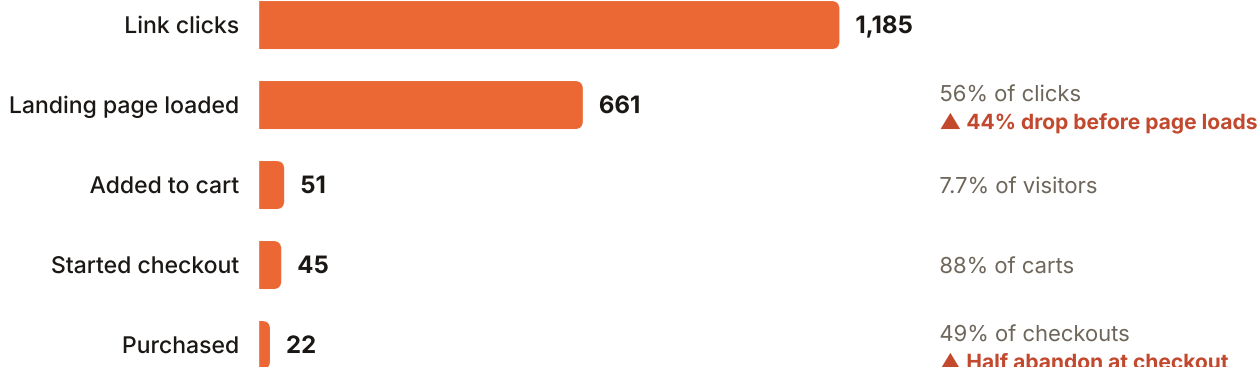

Meta's own recommendation on this ad set: turn automatic (Advantage+) audience on, for about 7% lower cost per purchase.

The funnel, and what Meta cannot see

Two leaks on our side of the click, plus a tracking gap that makes results look worse and gives learning less to work with.

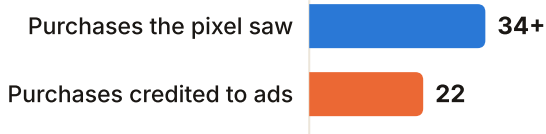

From click to purchase (new setup, 16 Sep–10 Oct)

Bar length = number of people at each step

Some sales are not credited to ads

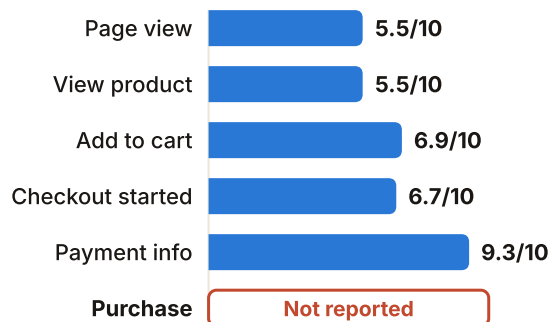

Purchase events on the site vs those Meta matched to an ad

Part of the gap is organic or WhatsApp sales. Part is probably ad sales Meta cannot match, because Purchase is sent **without the click ID**. Meta says fixing this typically doubles extra conversions reported.

Signal quality by event (out of 10)

How well Meta can match each event to a person

The event that matters most, **Purchase**, has no score at all.

So, is it the new manager?

Partly. Here is the split.

✓ Not their fault

Budget vs cost: any manager would sit in learning at ₹1,850/day.

ROAS was already weak before they joined (0.67).

Festive season: ad costs are high (₹229 per 1,000 views).

Short time: 3.5 weeks and ₹38K is a small sample.

! Their part

~9 resets in 25 days: no week ever ran clean.

Narrowed a "broad" campaign: automatic audience off.

Creatives swapped in the live ad set instead of tested separately; best ad paused for 2 days.

New ₹300/day ad set is iOS-only and optimises for add to cart, so it can never learn.

QUESTION 3

When can we see real return on ad spend?

Not on the current setup. Exiting learning usually trims cost per purchase by 20 to 40%. We need roughly 5x. If the changes below start this week:

By ~17 Oct

First clean 7 days. Cost per purchase should head back toward ₹1,000.

Late Oct to early Nov (Diwali)

2 to 3 stable weeks. Prospecting ROAS ~0.65+, retargeting clearly above 1.

Mid to late Nov

Decision point. Still above ₹1,200 per purchase after 4 clean weeks means the ad or offer is the problem, not learning.

The action plan, in order

Highest effect first

#	DO THIS	WHY	EFFECT	WHO
1	Freeze the main ad set for 7 days; budget moves $\pm 20\%$ max, every 3–4 days	Gives learning its first clean week	High	Manager
2	Add a retargeting ad set (₹300–500/day) using the cart, checkout and visitor audiences already built	45 checkouts started, 22 bought. These audiences exist but no ad uses them.	High	Manager
3	Fix purchase tracking: Conversions API via the Shopify Meta app, send click ID and contact on Purchase, check COD orders fire it	Credits sales we are missing and feeds learning more signal	High	Us + manager
4	Raise order value with bundles and combos aimed at ₹900+	Average order ~₹650, just over the ₹599 free-shipping line. ROAS rises in step.	High	Us
5	Test truly broad: all-India, automatic audience on, as its own ad set	The old broad setup beat the narrow one on every number	Medium	Manager
6	Test creatives in a separate ad set, then move winners in	Stops creative swaps from resetting the main ad set	Medium	Manager
7	Relabel or fold the "first club" ad set; drop iOS-only unless there is a reason	At ₹300/day on add to cart it cannot learn	Low	Manager

Ask the manager

- Why is automatic audience off in a campaign named "Broad targeting"?
- Why is the "first club" ad set iOS-only and on add to cart?
- What cost per purchase and ROAS are you aiming for, and by when?
- Can we agree on 7 days with no edits, and test creatives separately?

Not covered in this report

PROMUNCH Protein Snacks ad account: Meta has not opened it to the connector yet.

Real Shopify revenue: comparing it with spend gives true ROAS. Needs production read access.

Gross margin: needed to set an exact break-even ROAS and target cost per purchase.
